

Limit Switch

- Controls systems
- Acre counters
- Spray systems
- Auger systems
- Dairy operations

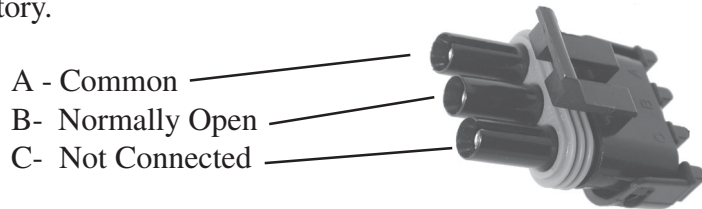

Universal limit switch for control applications

Overview

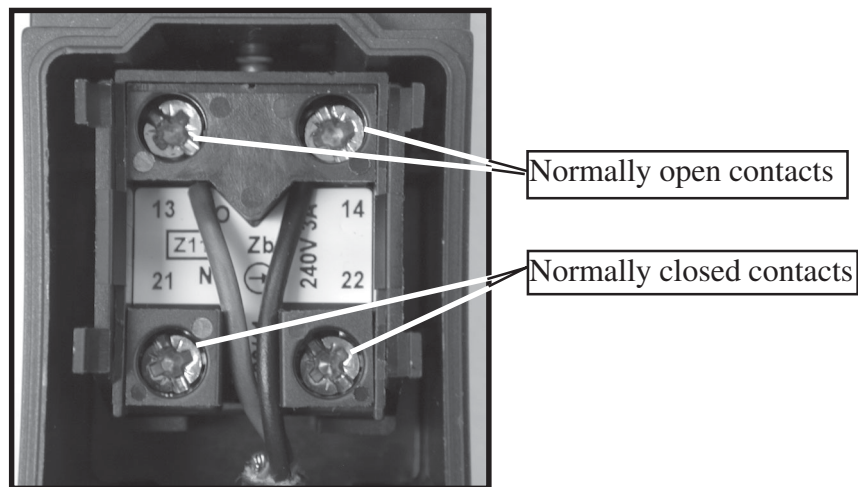

This universal limit switch is designed for applications where a heavy duty switch is needed to signal that the implement is in the up or down position.

The switch is designed so that it can be actuated from any direction. This makes the limit switch universal so that it will work on any application.

The 3rd wire is not connected to the terminal strip inside the switch but can be installed by the user if needed. The following is the wiring diagram for the switch as it is shipped from the factory.

Under the cover of the switch are 4 terminals. The units ship from the factory wired to the normally open contacts. (Switch must be deflected to close contacts). The wires can be moved to the lower (normally closed) contacts if needed.

Example Applications
